

Spectroscopic methods

Spectroscopic methods are the main tool of modern chemistry for the identification of molecular structures. In organic chemistry, spectroscopic methods are used to determine and confirm molecular structures, to monitor reactions and to control the purity of compounds. Most essential methods for the organic chemistry are the nuclear magnetic resonant spectroscopy (^1H) and ^{13}C NMR-spectroscopy, the mass spectrometry, the infrared and the UV/Vis-spectroscopy. In the following, frequently used German and English textbooks are listed, introducing the theory and applications of these methods on a basic course level.
